

EDU AI AGENT SUITE

Governed AI Agents for Education — Built on AWS

***The agents are not the product.** The governed platform that makes them deployable, auditable, and compliant with student-privacy law is.*

K-12 • Charter & Private • Community College • University • Online • Adult / Workforce

The data is already yours. The agents just need a safe way to reach it.

Locked away

Answers live in portals, PDFs, departmental pages, and staff inboxes — reachable only by someone who knows which screen to open.

Bounded agents

Production EDU agents retrieve approved info, analyze data, draft and recommend, call approved APIs, initiate low-risk workflows, and escalate exceptions.

Humans decide

They never autonomously decide grades, admissions, discipline, financial aid, special-ed eligibility, or placement.

The hard part isn't the model or the chatbot — it's giving agents clean, governed API access to the data itself.

Eight flagship agents on one governed platform

01

Student & Family Concierge

24/7 answers, status, cases — best first deploy

02

Tutor & Study Companion

Curriculum-grounded Socratic tutoring

03

Educator Copilot

Instruction, differentiation & LMS workflow

04

Assessment, Grading & Feedback

Rubric-grounded drafts; educator owns grades

05

Student Success & Engagement

Evidence assembly + proactive outreach

06

Pathway Navigator

Degree, transfer & career planning

07

Document & Accessibility

Enrollment intake + accessible content

08

Operations Service Desk

IT support + staff admin workflow

Start where risk is low and value is visible

Best first deployments

- 01 Student & Family Concierge — the single best entry point
- 03 Educator Copilot
- 07 Document & Accessibility Services
- 08 Operations Service Desk

Broad visibility · low decision-risk · measurable deflection & cycle-time

High-value, higher-governance

- 02 Tutor & Study Companion
- 04 Assessment, Grading & Feedback
- 05 Student Success & Engagement
- 06 Pathway Navigator

Touch learning & outcomes — stronger evaluation, oversight, bias testing

Land with 01 — it funds the shared gateway every later agent inherits for free.

The MCP authorization gateway — and why it comes first

A chatbot only needs to talk. An agent needs to act on a student's record — so who is allowed to do what, and the proof of every action, becomes the product.

AgentCore Gateway

Managed. Fastest to production, lowest ops burden.

Recommended default

AWS primitives

API Gateway + Lambda + Step Functions + STS.

For platform teams

FastMCP (self-built)

Own the MCP server code; maximum portability.

When you must own it

Identical controls across all three: verify identity & role · deny-by-default least privilege · human gate on consequential actions · short-lived scoped tokens · PII-masked append-only audit

Build it once on Agent 01; agents 02-08 inherit it. It's what passes the CISO, privacy, and registrar review.

Six layers, cleanly separated

The user's identity follows every request; the SIS/LMS/ERP/CRM stays the system of record; any agent or tool can be disabled instantly.

The regulation stack, enforced in the platform

FERPA

Identity-scoped access; rights transfer at 18; school-official direct control; disclosure audit

COPPA

Under-13 flag drives heightened Guardrails, data minimization, no non-educational use

PPRA

No protected-category inference; outreach grounded in operational signals only

IDEA / 504

Eligibility & placement are human decisions; IEP/504 data heightened-sensitivity

ADA / 508 / WCAG 2.2 AA

Accessible student-facing surfaces; accessible content transformation

State privacy (~140 laws)

Residency, retention, consent & prohibited-use are configuration

The bright line: no agent autonomously decides grades, admissions, discipline, financial aid, special-ed eligibility, or placement.

Education is already deploying these patterns

94.5%

adoption of UA-Pulaski Tech's AWS agent (MyAgent); +253% admissions-content engagement

75%

fewer status emails, calls & visits at Highline College's financial-aid self-service

4-6 wks to ~1 day

Illinois Tech transcript / credential evaluation turnaround on AWS AI

UT Sage

UT Austin's faculty-guided Bedrock tutor (Textract, Lambda, DynamoDB, OpenSearch, Cognito)

Sources: AWS Public Sector Blog (Pulaski/Modo Labs, Highline, UT Austin); Illinois Tech case study. Measured outcomes, not chat volume.

Baseline five categories — outcomes, not conversations

1

Labor

Minutes/case • staff hours • overtime • seasonal staffing

2

Service

Response & wait time • first-contact resolution • after-hours availability

3

Learning

Mastery • course pass rate • feedback turnaround • engagement

4

Student journey

Enrollment completion • attendance • persistence • graduation

5

Risk & quality

Error & escalation rate • overrides • privacy incidents • equity gaps

A tutoring agent with high usage but no measurable learning gain is not a success. An enrollment agent with a 70% cut in processing time is.

A governed, testable, deployable starting point

Shared platform

LLM factory • student-PII masker • MCP gateway • connectors
(SIS/LMS/CRM/ITSM/ERP)

Governance in code

Grounding • hash-pinned prompts • HITL gate tests • red team • fairness

8 agents

LangGraph workflows • gateway-scoped tools • deterministic demo • Streamlit

AWS deployment

CloudFormation + Terraform • AgentCore container (/invocations, /ping)

Field & GTM

Positioning • offerings (POC to managed) • stakeholder briefings • TPRM

Verified

Runs with no API key • full test suite green • marquee proof points checked

Maturity: Documented + Demonstrated, Deployable-by-design. Production-readiness (CSV, IdP, live connectors, WCAG, pen test) is the engagement.

From proof to production

Fund the gateway in Phase 1 — far cheaper to build first than to retrofit governance across eight agents later.

The difference between eight pilots and eight agents in production

Bounded agents. One governed gateway. A compliance spine that compounds. Outcomes you can measure.

Land with the Student & Family Concierge — then expand across the portfolio.
